

Year 8 Geography
Week Beginning 13th July 2020
Development

What is 'development' in Geography? How do we measure how 'developed' a country is? Why are some countries considered more developed than others?

Tasks:

1. Work your way through the 'Development Indicators' information sheet (core or foundation).
2. Choose three countries in the world. These can be in different continents or across the same continent.
3. Measure the level of development across these countries using at least two of the development indicators from the information sheet. For example; life expectancy, GDP, HDI.
4. Decide how to present this information for example using annotated maps, graphs, charts etc.
5. Explain which country you think is more developed using your evidence from the development indicators.
